COMPRESSED LEXICON AND METHOD AND APPARATUS FOR CREATING AND ACCESSING THE LEXICON

ABSTRACT OF THE DISCLOSURE

A compressed lexicon is built by receiving a includes word-dependent word list. which associated with each word in the word list. A word is selected from the word list. A hash value is generated based on the selected word, and the hash value identifies an address in a hash table which, in turn, is written with a location in lexicon memory that is to hold the compressed form of the selected word, and the compressed word-dependent data associated with the selected word. The word is then encoded, or compressed, as is its associated worddependent data. This information is written at the identified location in the lexicon memory.
